Read This First

Delete this slide and every yellow hint box before you present.

5 minutes max
Practice out loud with a timer.

Both partners speak
About equal time for each of you.

An image on every slide
Pick a picture that fits what the slide says.

Label AI images
Write "AI-generated" under any AI-made image.

Capitalize slide titles
Use Title Case on every slide.

Few words, no reading
Short phrases. Do not read your slides.

Hypothesis and null hypothesis
Each gets its own slide: If, then, because and "no difference".

Cover every rubric row
Combine slides if needed, but cover them all.

Check the rubric on the class site, then use the Grade Yourself page before you present.

Materials and Methods

Our Exercise Science Experiment

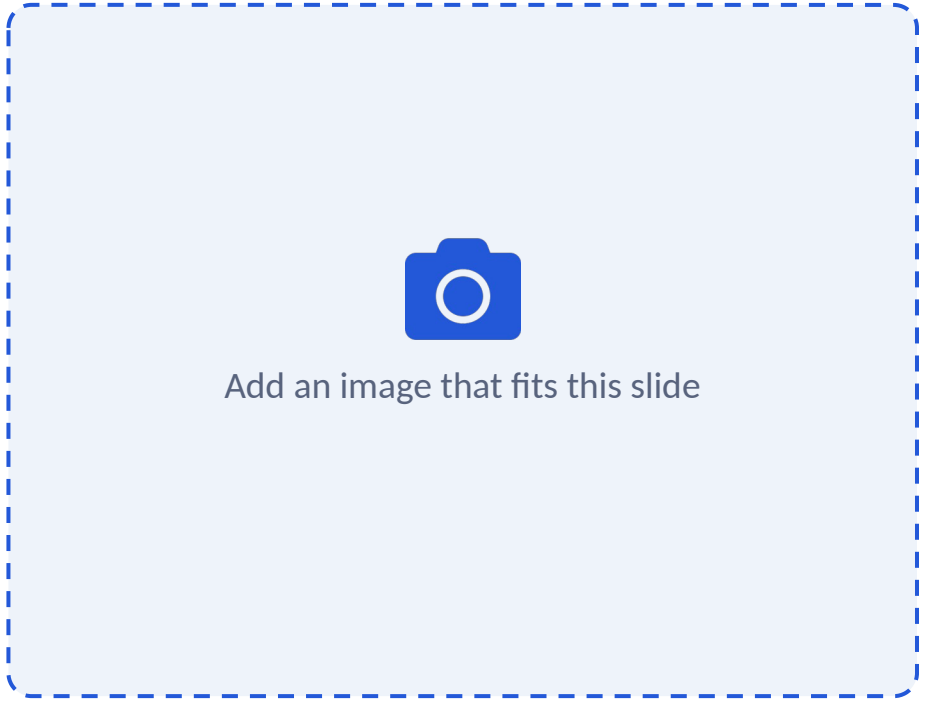

Partners: First Name and First Name

Add an image for your title slide

Our Experiment in One Sentence

We tested whether _____ changes _____ in _____.

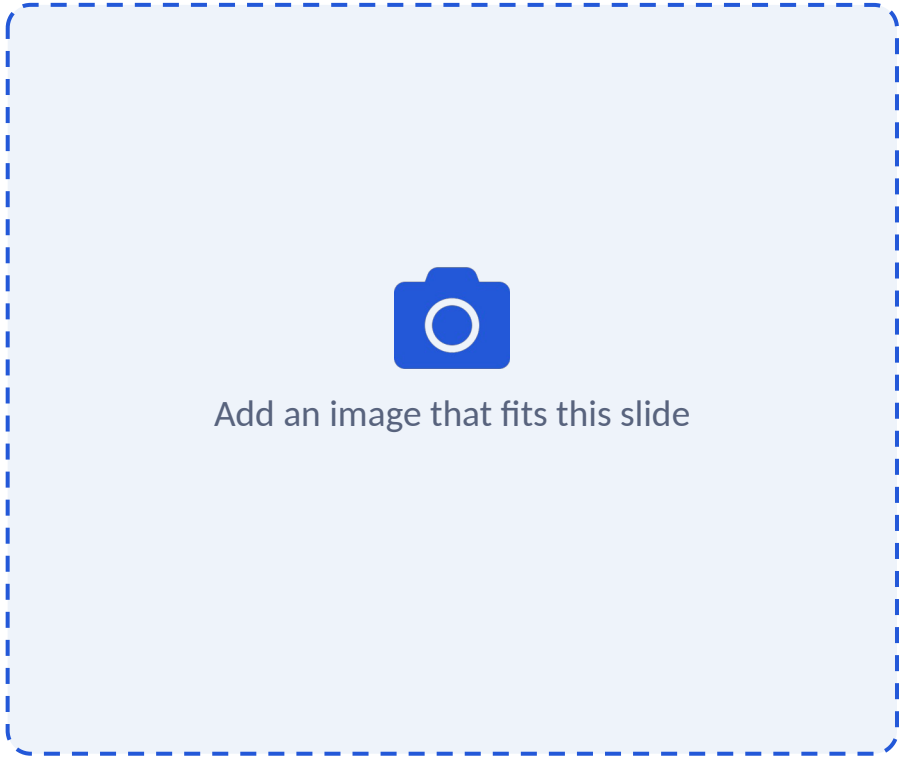

Hint (delete this box): One sentence. Very brief. Say what you change and what you measure.

Our Research Question

Research Question

Does _____ change _____?

Hint (delete this box): A clear question you can test with numbers. Example: Does jogging in place for 60 seconds raise heart rate more than jogging for 30 seconds?

What We Change and What We Measure

Independent Variable

What we change:

_____

Condition A: _____

Condition B: _____

Dependent Variable

What we measure:

_____

Units: _____

Trials

We ran _____ trials of each condition (_____ in all) because _____.

Add an image (a photo or picture)

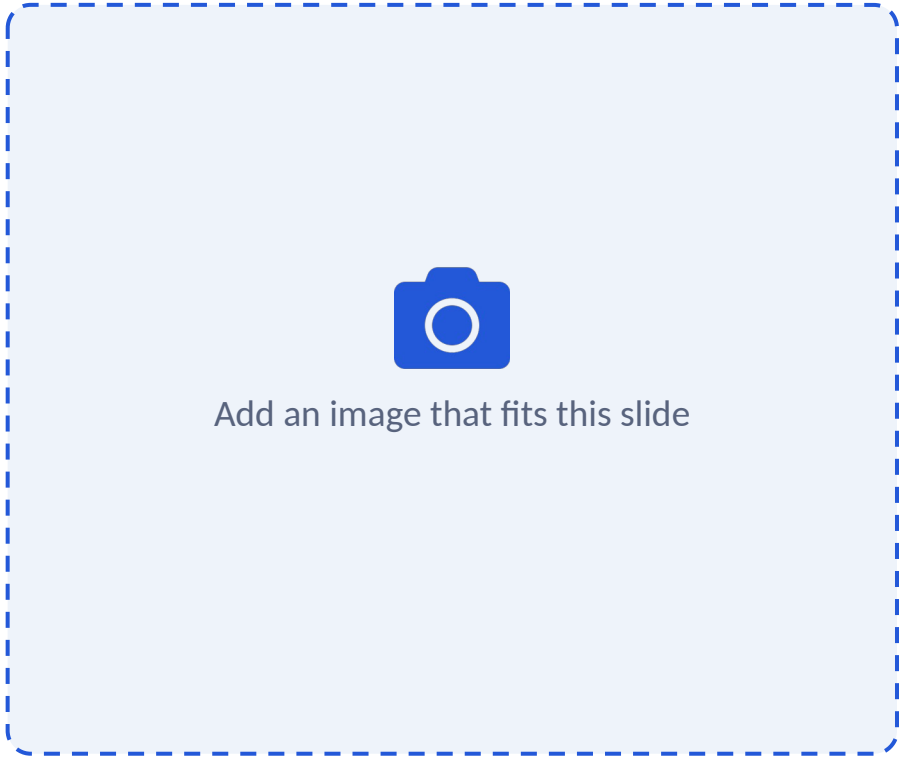

Hint (delete this box): The independent variable is the one thing you change. The dependent variable is a number you measure. Say how many trials you ran and why you chose that number.

Our Hypothesis

Hypothesis (If, Then, Because)

If _____, then _____, because _____.

Hint (delete this box): Make a prediction. Use If, then, because, and connect it to your research question.

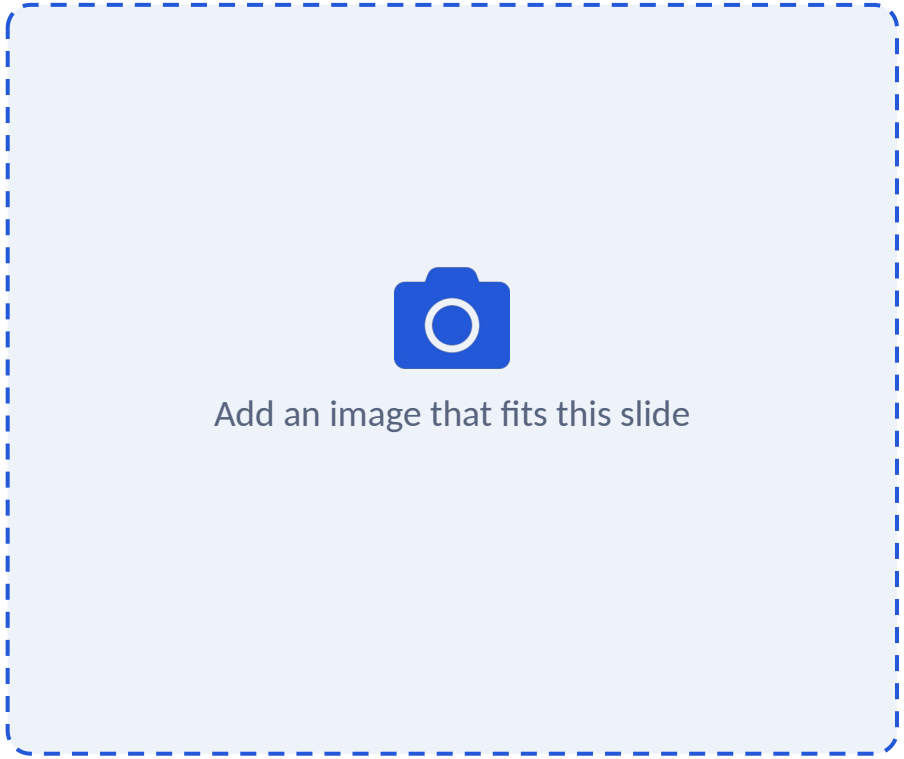

Our Null Hypothesis

Null Hypothesis (No Difference)

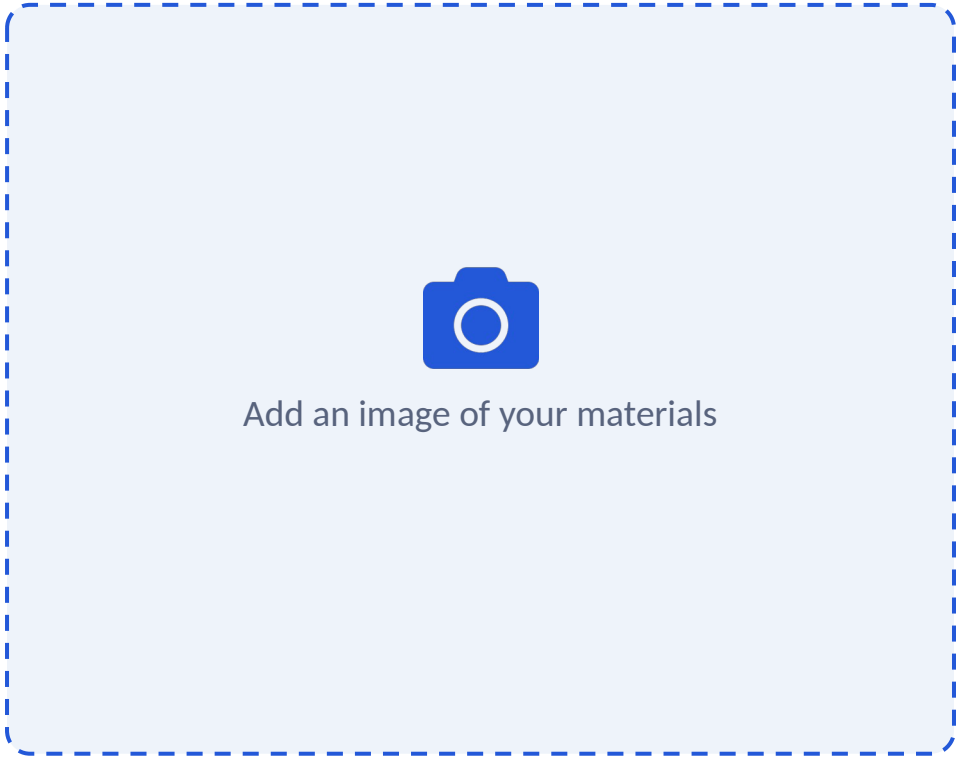

There will be no difference in _____ between _____ and _____.

Hint (delete this box): The null hypothesis says what you change makes NO difference to what you measure. Your p-value will test it later.

Materials

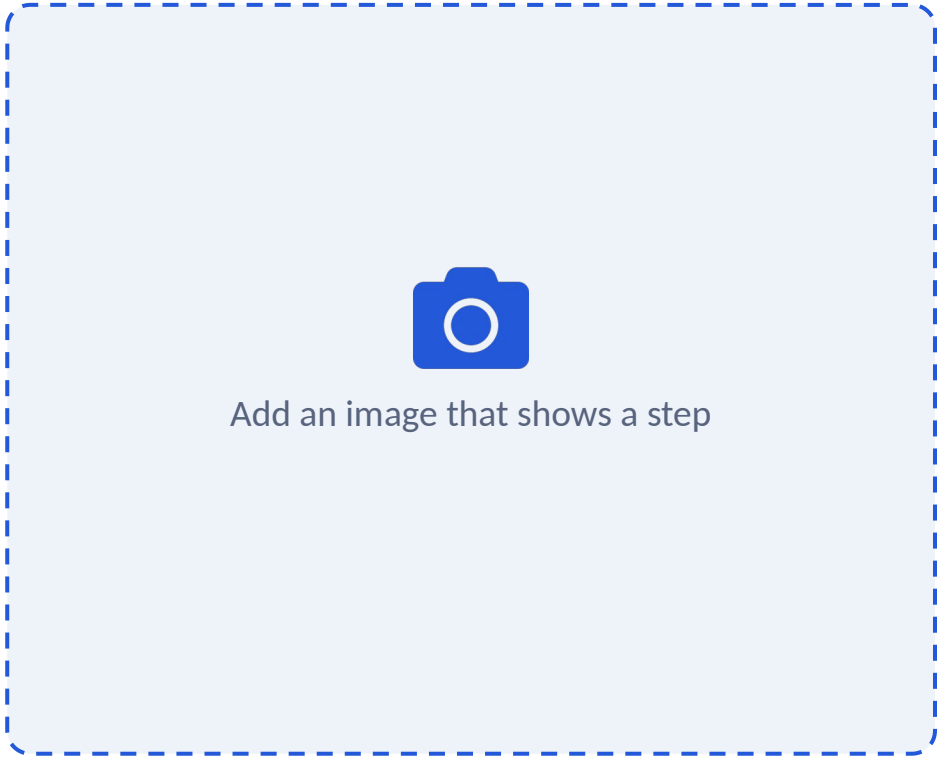

- Item and amount: _____
- Item and amount: _____
- Item and amount: _____
- Item and amount: _____
- Item and amount: _____

Hint (delete this box): A complete bullet list. Be specific, like "30 cm ruler" or "phone stopwatch", not just "timer".

Our Procedure: Part 1

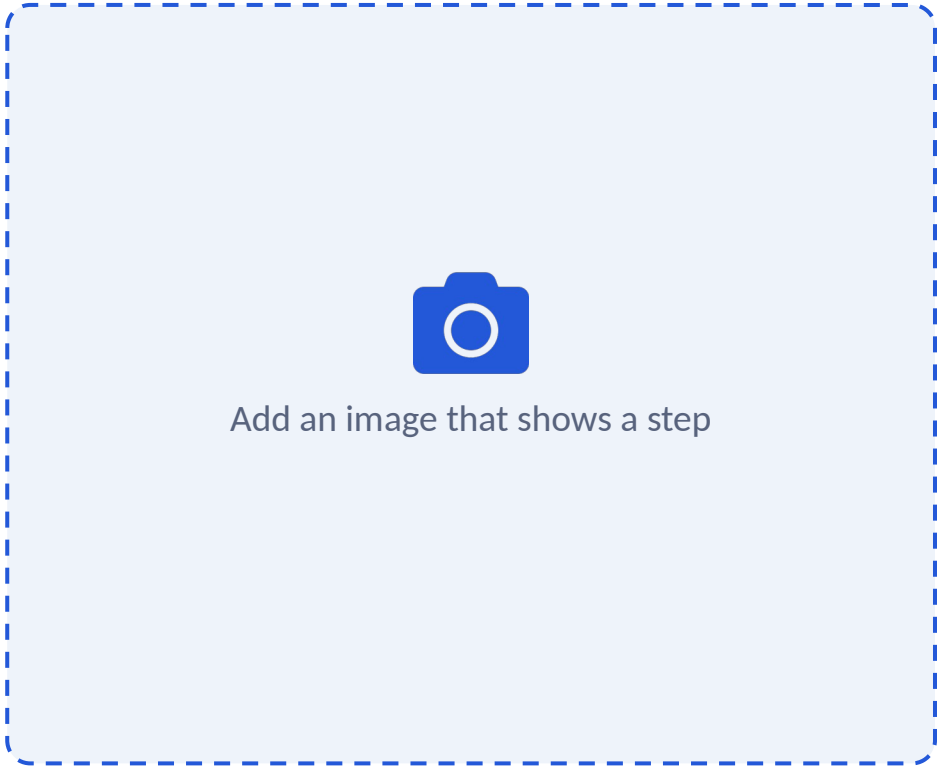

1. Step 1: _____
2. Step 2: _____
3. Step 3: _____
4. Step 4: _____
5. Step 5: _____

Hint (delete this box): Another group should be able to repeat your experiment from these steps alone. Include numbers and times.

Our Procedure: Part 2

1. Step 6: _____
2. Step 7: _____
3. Step 8: _____
4. Step 9: _____
5. Step 10: _____

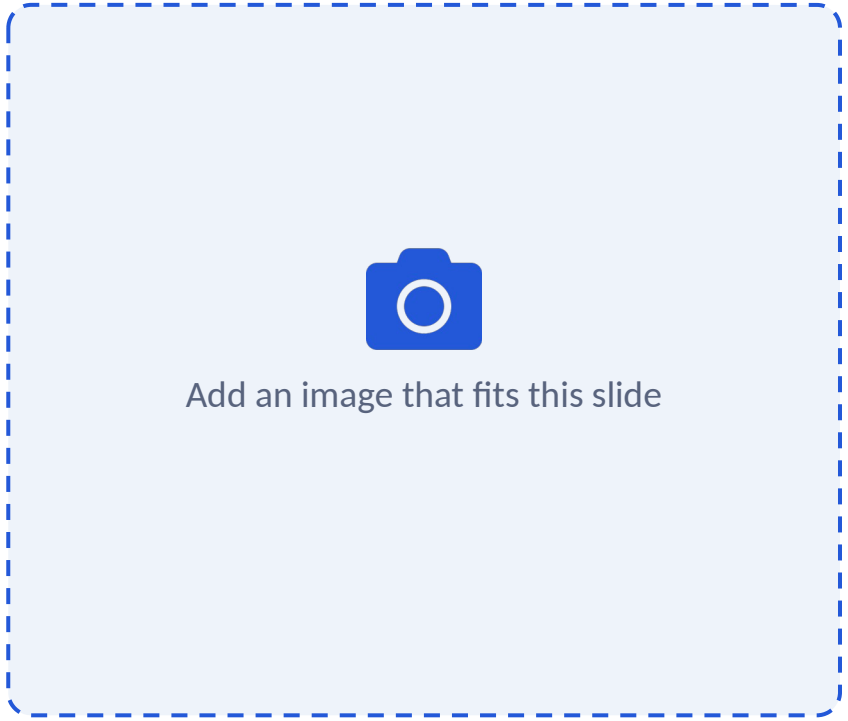

Rest Between Trials

We rested _____ minutes because _____.

Hint (delete this box): Say how you recorded your data. Is the rest between trials long enough, and why? Delete this slide if Part 1 was enough.

Our Data Table Layout

Trial	Condition A: _____ (units)	Condition B: _____ (units)
1		
2		
3		
4		
5		

Hint (delete this box): Show the layout only. No numbers in the cells. Capitalize Important Words in the headers, put the units in the headers, and leave a row for every trial. If you measure heart rate or time, add Before, After, and % Change columns.

What We Keep the Same and Cannot Control

We Keep These the Same

- Control 1: _____
- Control 2: _____
- Control 3: _____

We Cannot Control (and Why)

- _____ because _____
- _____ because _____

Add an image of your setup

Hint (delete this box): Name at least 3 controls and explain each one. Think of time of day, place, rest, and who measures.

Timeline and Planning

Hours We Need

We estimate _____ hours in all.

Why We Chose That Number

Because _____.

Our Plan: When and Where

We will _____ on _____ at _____.

Add an image of where you will collect data

Hint (delete this box): A realistic hours estimate with a reason, and a specific plan for when and how you will finish.

Questions from the Audience

Thank you!
